

## Divide by Zero Errors

	A
1	10
2	0
3	=A1/A2

	A
1	10
2	0
3	#DIV/0!

If the divisor is zero, the desired result should be zero, but because you cannot divide by zero, Excel displays a divide by zero error.

	A	B	C
1	10		
2	0		
3	=IF(ISERROR(A1/A2),0,A1/A2)		

	A
1	10
2	0
3	0

The formula reads: **if** there is an error when dividing A1 by A2, **then** return a value of zero, **else** do the divide and display the result.

The ISERROR function returns TRUE if the result is #DIV/0. It will also return true for #N/A, #VALUE, #REF, #NUM, #NAME, or #NULL. The function name can be either ISERR or ISERROR.
